

COMP4711 Lab 1 (Winter 2009)
Dates: Jan 12-16, 2009

Tool: NetBeans
Model: Webapp

Background

We have had our first lecture, and talked about JSPs a bit. The purpose of this lab is to expose you to the webapp model used by NetBeans, before we dive too deeply into JSPs.

This is an individual lab.

Lab Tasks

1. Work through the [basic introduction to developing webapps](#) tutorial, in NetBeans 6.5. This will give you a feel for the webapp notion as implemented in NetBeans, and will introduce you to some of the different kinds of pieces that we will be working with as part of this course. Don't worry if the pieces don't all make sense yet.
2. Start a new webapp project, "lab1", and pick one of the open source website templates from Open Source Web Design (www.oswd.org) to provide the "webapp" portion of it. This will have greeked or dummy text, and that is fine. We ideally want a one-column body with a navbar down the left.
3. You want to end up with a "complete" "functional" website when the project is run – that means several pages and a functional navbar.
4. Zip up your netbeans project and submit it to share-in, using a suitable name, like ParryJimComp4711Lab1.doc (note: surname followed by first name).

Marking Guideline

This lab will be marked out of 10 (no specific breakdown).

Submission

- Your zipped netbeans project, as noted above.
- Due by the end of the weekend (sunday 11:59pm)

Note: The tutorial can also be accessed from inside Netbeans through Help->Online docs & support->Java Web App Learning Trail->Intro to ...
