COMP 4908 • BCIT • May 4, 2009

WEEK IN OVERVIEW

This, the first week with our current project, has been very productive. We met with our client, TechSol, on April 28th discussed what was needed as well as the scope of the project at hand. Interestingly enough, the proposal that TechSol submitted to BCIT was fairly accurate with regards to what the project entailed.

During our meeting with TechSol, we discovered more details about the project and the specific requirements that they had in mind. Additionally, we discovered that what they are more interested in having from our group is not the application itself, but for us to become somewhat of experts with the WebKit application framework such that we could provide expert advice on how to make full use of the framework.

We agreed that throughout the process of developing this application, we would produce as much documentation as we could with respect to the WebKit framework, its limitations, and any bugs we encounter.

TASKS COMPLETED BY MAY 3RD

- Initial Prototype (no features, just get something working)
- Set up SVN and project management site
- Define code formatting and commenting standard

TASKS NOT COMPLETED & WHY

All of the tasks we had planned for the week were met and in some cases exceeded.

TASKS SCHEDULED FOR COMPLETION BY MAY 10TH

- Fullscreen mode
- Benchmark the prototype (to generate a base-line)
- Finalize SVN Directory Structure (almost done)
- Determine what is handling highlighting (so we can disable it)
