COMP 3711: IBM Functional Test

EXAMPLE OF SETTING UP AN APPLICATION TO TEST

1. With the project open, click **C*onfigure*** and click "***Configure Applications for Testing…***"
2. In the window that pops up, click on the Add button.
3. In the next window that pops up, you will select the type of application you want to test:
    a. Java Application: If you want to test a Java application you will need a Java jar file.
    b. HTML Application: If you want to test an HTML application on the web you will have to have a URL to the site
    c. Executable or Batch file: If you want to test an application for which you have an exe file.
4. Click *next*
5. Depending on your selection in #5:
    a. Java Application: Use the Browse function to find your jar file and click on *Open*
    b. HTML Application: Choose the *URL* radio button and type in the URL: Example: www.google.com
    c. Executable or Batch: Use the Browse function to find your exe file and click on *Open*. For example: c:\WINDOWS\notepad.exe
6. Click on *Finish*
7. You will see on the left hand side that your application has been added.
8. Click "*Apply*" then Click "*Finish*"

Setting up Functional tester for Scripting is now Complete.
When you start recording your script, you will find your newly configured application in the drop down list in the *Start Application* window.
